

Chanca Piedra Powerful "Stone Crusher" Helps Dissolve, Eliminate and Prevent Kidney (& Gall) Stones

Literally translated, chanca piedra means "stone crusher" and this herb is a must for those with a history of kidney or gall stones!

Chanca Piedra has been found in studies to slow crystallization, reducing the formation of stones, and smoothing the shape and changing the texture so they will break up and pass more easily. The addition of magnesium keeps calcium more soluble, making calciferous stones less likely to form - (about 90% of kidney stones are formed from calcium) and B6 acts as a slight diuretic, encouraging regular urination and less likelihood of minerals building up in the kidneys to form crystals.
