

# Glucosamine or Chondroitin?

*If you suffer from Osteoarthritis, you need to read this*

When taken orally, studies prove that glucosamine sulfate — not chondroitin sulfate — blocks the release of inflammatory chemicals found in osteoarthritis. Glucosamine sulfate is also the only known substance that blocks the destruction of joint cartilage — the hallmark feature of osteoarthritis. After age 40, our bodies make less glucosamine, so taking a small amount beginning in our 40s can **prevent it**; if damage is already present, larger amounts can help to halt the destruction and possibly **prevent** the need for **surgery**.
