Why we need an "Industrial-Strength" Antioxidant for Living in Today's World

Since WWII an estimated 85,000 synthetic chemicals have been

registered in the U.S. alone. Today's environment now exposes us to various pesticides, herbicides, plastics, xenoestrogens and pollutants in our food, water and air. The human body has had very little time to adapt to these new challenges, possibly resulting in an over-taxed detoxification system, suppressed immune function and other undesirable health effects. Many experts believe that the new chemical environment in which we live is a major contributing factor to the high incidence of many degenerative diseases in the modern era.

In the toxic world in which we live, our liver, detoxification and immune systems require additional support to maintain and optimize glutathione levels. In addition to being a premiere cellular antioxidant, Glutathione is REQUIRED for detoxification of the many dangerous environmental chemicals we're exposed to EVERY DAY; also, in many chronic liver conditions and immune-compromised states, glutathione levels are reduced or depleted. Thankfully, the body's glutathione levels can be restored through supplementation. Although Glutathione supplements are not absorbed efficiently by the digestive tract, studies have shown that supplementing with the correct ratios of L-Glutamine, N-Acetyl Cysteine and Alpha Lipoic Acid will more effectively raise glutathione levels in the body.
