

The Estrogen - Osteoporosis Connection

Stop the Calcium Leak, safely

A 90% decline in estrogen levels that accompanies menopause permits calcium to leak out of bone. This leads to osteoporosis, increasing risk of fractures. Osteoporosis is reaching epidemic proportions in our society mostly due to insufficient calcium intake, and loss of calcium from bone during the menopausal years. Black Cohosh and Soy Isoflavones have been shown to mimic the effects of estriol, a very weak form of estrogen made by the body, which **helps hold estrogen in the bones** and does not increase the risk of reproductive system cancer. In addition, combined with rice bran extract (gamma-oryzanol), these ingredients in Adëeva's **Women's Hormonal Balance** can help to reduce hot flashes, sleeplessness, night sweats, and mood swings associated with menopause and with the common symptoms of PMS.
